INTRODUCTION

In order to learn more about ground-water reserves and to obtain accurate data on the changes of the ground-water level in various parts of the state, the Indiana Department of Conservation in cooperation with the United States Geological Survey, as early as 1935, inaugurated a program of periodically measuring the water level in a number of unused wells. This was the start of the observation well program which has continued uninterrupted for more than 20 years and has supplied important basic information essential to the evaluation of the state's ground-water resources. During that year and the year that followed the program included 71 observation wells, most of which were located on state properties.

In 1943 the 83rd General Assembly enacted a law authorizing the Indiana Department of Conservation to expand its activities in the study and investigation of the water resources of the State in cooperation with the U. S. Geological Survey. When this expanded program was put into effect, the observation well project was greatly enlarged; the newer wells being selected to provide a more uniform distribution throughout the state. Since 1943 a number of the early wells have been discarded and new ones added in order to improve the quality of the data obtained from this program. Figure 1 shows the location and distribution of the observation wells in the state contained in this report.

The records of water levels in observation wells have been published annually in the U. S. Geological Survey Water Supply Papers. Previous to 1952, the records of all observation wells in the state appeared in the water

supply papers but since that time only the records of 32 key wells have been published each year. A list of the water supply papers will be found on p. 111. The 32 key wells were selected on the basis of the geographical location, proximity to weather stations, geological conditions, and the length and quality of the available records. Changes in the ground-water levels in the key wells throughout the state for the year are covered in the annual reports. This report summarizes the records of the 32 key wells for their entire period of record and includes the records of other observation wells previously published in the water supply papers. Since all observation well records in the future are to be summarized for publication on a 5 year basis the records of those wells, not included in the 32 key wells, begin with the year 1950 in this report. These records facilitate the study of long range trends in ground water levels by combining the tabulated data in the annual reports.

The water-table, or ground-water level, is the surface of the saturated zone and its elevation not only varies in different localities but it fluctuates in a given area. The water table is not level, as the surface of a lake, but conforms in a general way to the broader features of the land surface and is higher, as a rule, under hills than in valleys. However, on the uplands this level is usually at a greater depth below the surface than it is in the lowlands. The water level may occur at the land surface where there are springs or natural lakes and swamps.

The infiltration of rainfall and melted snow causes the water level to rise, and it is lowered during periods of drought when there is relatively little recharge to ground-water reservoirs. Examples of such changes are shown

in figures 2, 3 and 4, which show fluctuations of water levels in observation wells over a period of years and the relation of these changes to precipitation recorded by nearby climatological stations. In figure 5 is shown the effect of a single rainfall of .75 of an inch on the water level in an observation well in Adams County. Also losses due to transpiration may have an effect on ground water levels. An example of this effect is shown in figure 6, which shows the decline in the water level in an observation well in Montgomery County.

In addition to these natural causes, ground-water levels are affected by the pumping of wells. The ever increasing demand for more water in both rural and suburban areas has resulted at times in withdrawals in excess of natural recharge in some localities and the effect of pumping is an important factor in making hydrologic and hydraulic studies of underground waters. An example of the effect that the pumping of a nearby well has on the water level in an observation well in Indianapolis is shown in figure 7.

The observation well program has a number of objectives, chief among which is to aid in the evaluation of available ground-water supplies. As a long term program it supplies basic information on ground-water conditions and the fluctuations of ground-water levels under varying climatic changes and local environments. The records obtained in the observation well program serve as a guide in the prediction of trends in ground-water levels so that some knowledge may be gained regarding future supplies. These data help in determining the factors that influence ground-water levels and all such data can be used in the study of water supply problems.

In this report observation wells are designated by a two-letter symbol

corresponding to the county name in which the well is located, followed by a number for successive wells. The first observation well in Allen County, for example, is designated as Al-1. Water levels are in feet below land surface datum, unless otherwise indicated. When the water level is above the land surface for some measurements and below at others, a minus and plus sign is used preceding the first entry in each column.

For the past several years, numerous reports regarding a general lowering of the water table in Indiana have been circulated. As a result of the dry periods many shallow wells, especially in the southern part of the state have failed. Such conditions have started rumors, some of which have been exaggerated, that have lead some people to believe that other wells in the state may go dry.

The water levels in much of Indiana have been lowering for the past five years. This situation is not alarming; it has occurred before - such as in 1941 and 1944 - and will surely happen again; a natural situation. A period of normal or above normal precipitation causes correspondingly high water levels. The opposite is also true - a dry period is reflected in lower water levels.

A look at the records contained in this report shows that water levels have been on a downward trend since 1950. In that year and for a short time before, the levels in observation wells were relatively high, and a decline from these levels does not necessarily mean that they are below average. During the period, 1951-54, precipitation was less. In 1952, 1953 and 1954 annual precipitation was below normal; 1953 being the lowest in recent years.

Each year since 1950, seasonal recoveries in the fall have been occurring later, often coming during the first part of the following year and not reaching as high a level in some wells as during the previous year.

Toward the close of 1954, however, precipitation in the northern division of the state caused a reversal of water levels to the point that water levels in some observation wells were above average. Precipitation in the central division had raised many levels to about average. The southern division had less precipitation and, although water levels in some localities remained critically low; with indications that the levelling off period was approached.

Above-normal precipitation during the latter part of 1949 reversed many water levels, starting them on an upward seasonal trend. This condition, coupled with the fact that the 1950 precipitation in the state was above normal for all months except March, May, October, and November, caused water levels over practically the entire state to be relatively high. The fact that during 1950, sixty-eight of the one hundred and seventy reporting observation wells reached a new high for the period of record reflects the magnitude of this rise in water levels.

Because of the record-breaking above-normal precipitation in 1950, water levels in 1951 were above average, with many remaining so throughout that year. Precipitation during 1951 was above normal (but below 1950). During the recharge period at the end of the year, precipitation fell on frozen ground with the result that water levels were lower than at the end of the previous year but were still slightly above average. A dry spell in southern

Indiana was relieved by above-normal precipitation in November and December.

By 1952, a downward trend was in evidence. Water levels at the beginning of the year were near average or slightly above. In the central and northern divisions the water levels were close to average throughout most of the year. Moderate to heavy snowfall covered much of northern Indiana in December, but had little effect upon water levels. Declining water levels were noted in southern Indiana due to a rain-fall deficiency which was intensified by very hot temperatures particularly during the month of July. Widespread drought conditions were prevented by scattered rain-fall. Water levels at the end of the year were slow in recovering with many levels in southern Indiana being well below average.

In general, water levels over the entire state continued on a downward trend in 1953. Low levels of 1941 and 1944 were approached and even exceeded in observation wells in some localities. Seasonal recoveries that normally occur during the latter third of the calendar year did not reverse from seasonal downward trends until early 1954. More than one-third of the reporting observation wells reached all-time lows in 1953. This decline is tied in directly with precipitation which was more than eight inches deficient for the state. With very few exceptions, water levels in the southern division of the state remained well below average throughout the year. By the end of the year, water levels in observation wells in this division averaged more than four feet below average. By the end of 1953, water levels over the entire state were below average.

Seasonal recoveries in 1953 were late, but some occurred during the early part of the year 1954. The calendar year 1954 was started with water levels being below average over the entire state. Light precipitation during the first part of the year started slight upward trends in some wells, but, as late as March, seasonal recoveries (recharge) lagged in both magnitude and time with only a few water levels in the southern division showing slight reversals upward. Scattered precipitation in the state was not sufficient to overcome the deficiencies realized during the previous two or three years and water levels remained below average. In the northern division heavy precipitation by the first of November brought the water levels in most wells up to or above average. A few wells in the central division were near average by the end of October, but in the southern division water levels declined and remained critically low.

RECORDS OF WATER LEVELS IN INDIANA OBSERVATION
WELLS IN U. S. GEOLOGICAL SURVEY WATER SUPPLY PAPERS

- WSP 777- Water levels and artesian pressure in observation wells in the United States in 1935. Indiana by R. C. Cady, p. 60-61, 1936.
- WSP 817- Water levels and artesian pressure in observation wells in the United States in 1936. Indiana by V. T. Stringfield, p. 43-54, 1937.
- WSP 840- Water levels and artesian pressure in observation wells in the United States in 1937. Indiana by V. T. Stringfield and M. M. Fidlar p. 69-88, 1938.
- WSP 845- Water levels and artesian pressure in observation wells in the United States in 1938. Indiana by C. L. McGuinness, p. 68-84, 1939.
- WSP 886- Water levels and artesian pressure in observation wells in the United States in 1939. Indiana by C. L. McGuinness, p. 95-112, 1940.
- WSP 906- Water levels and artesian pressures in observation wells in the United States in 1940, Part 1, Northeastern States. Indiana by C. L. McGuinness, p. 16-35, 1941.
- WSP 936- Water levels and artesian pressures in observation wells in the United States in 1941, Part 1, Northeastern States. Indiana by C. L. McGuinness, p. 20-41, 1942.
- WSP 944- Water levels and artesian pressures in observation wells in the United States in 1942, Part 1, Northeastern States. Indiana by C. L. McGuinness, p. 19-37, 1943.
- WSP 986- Water levels and artesian pressures in observation wells in the United States in 1943, Part 1, Northeastern States. Indiana by F. H. Klaer, Jr., and J. G. Ferris, p. 18-39, 1944.
- WSP 1016- Water levels and artesian pressures in observation wells in the United States in 1944, Part 1, Northeastern States. Indiana by F. H. Klaer, Jr., and J. G. Ferris, p. 25-77, 1945.
- WSP 1023- Water levels and artesian pressures in observation wells in the United States in 1945, Part 1, Northeastern States. Indiana by F. H. Klaer, Jr., and R. W. Stallman, p. 22-88, 1946.
- WSP 1071- Water levels and artesian pressures in observation wells in the United States in 1946, Part 1, Northeastern States. Indiana by F. H. Klaer, Jr., and B. W. Swartz, p. 20-91, 1947.

WSR 1096- Water levels and artesian pressures in observation wells in the United States in 1947, Part 1, Northeastern States. Indiana by F. H. Klaer, Jr., and B. W. Swartz, p. 21-92, 1948.

WSP 1126- Water levels and artesian pressures in observation wells in the United States in 1948, Part 1, Northeastern States, Indiana by F. H. Klaer, Jr., and B. W. Swartz, p. 19-88, 1949.

WSR 1156- Water levels and artesian pressures in observation wells in the United States in 1949, Part 1, Northeastern States, Indiana by B. W. Swartz and F. H. Klaer, Jr., p. 18-90, 1950.

WSP 1165- Water levels and artesian pressures in observation wells in the United States in 1950, Part 1, Northeastern States. Indiana by B. W. Swartz and F. C. Mikels, p. 18-79, 1951.

WSP 1191- Water levels and artesian pressures in observation wells in the United States in 1951, Part 1, Northeastern States. Indiana by G. E. Davis, B. W. Swartz and P. E. Ward, p. 17-34, 1952.

PUBLICATIONS OF COOPERATIVE GROUND-WATER PROGRAM

Report

Ground-water resources of the Indianapolis area, Marion County,
Ind. C. L. McGuinness. Ind. Dept. Cons., Div. Geology.
1943.

Bulletins

1. Memorandum concerning a pumping test at Gas City, Ind.
J. G. Ferris. Ind. Dept. Cons., Div. Water Resources. 1945.
2. A preliminary report of the ground-water levels of the state
based on records of twenty-six observation wells for which
long time records are available. Anonymous. Ind. Dept. Cons.,
Div. Water Resources. 1946.
3. Ground-water resources of St. Joseph County, Ind. Part 1,
South Bend area. F. H. Klaer, Jr., and R. W. Stallman.
Ind. Dept. Cons. Div. Water Resources. 1948.
4. Ground-water resources of Boone County, Ind. E. A. Brown.
Ind. Dept. Cons., Div. Water Resources. 1949.
5. Ground-water resources of Noble County, Ind. R. W. Stallman
and F. H. Klaer, Jr. Ind. Dept. Cons., Div. Water Re-
sources. 1950.
