

"Energetic Initiatives for People, Community and Planet"

Energetic Initiative for People, Community, and Planet

An overview of sustainability energy projects conducted at AstraZeneca – Mt. Vernon.

Who are We?

We are a global, science-led biopharmaceutical business and our innovative medicines are used by millions of patients worldwide.

Mount Vernon Oncology Specific Cardiovascular, Renal and Metabolism

Our purpose:

We push the boundaries of science to deliver life-changing medicines.

AstraZeneca

What sustainability means at AstraZeneca

Our sustainability strategy

We have nine material focus areas, each with their own targets, grouped under three interconnected priorities:

Access to healthcare

Environmental protection

Ethics and transparency

Our ambitions

Promoting prevention, increasing access to life-saving treatments, and strengthening health system resilience and sustainability.

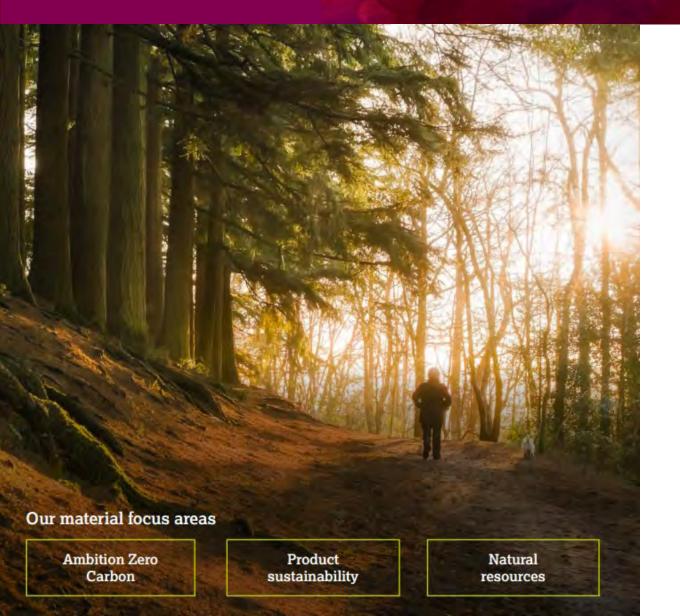

Accelerating the delivery of net-zero healthcare, proactively managing our environmental impact across all activities and investing in nature and biodiversity.

Ensuring ethical, open and inclusive behaviour across our organisation and value chain.

What sustainability means at AstraZeneca

Accelerating the delivery of net-zero healthcare, proactively managing our environmental impact and investing in nature and biodiversity.

"AstraZeneca announces \$400 million investment in reforestation and biodiversity in support of climate action and human health"

- Announced June 28, 2023

"AstraZeneca announces innovative partnership with Vanguard Renewables to decarbonize its United States sites"

- Announced June 13, 2023

Greenhouse Gases (GHGs) Primer

Scope 1 emissions are greenhouse gas (GHG) emissions that are released into the atmosphere directly from activities that an organization owns or controls. These emissions can include:

Fugitive emissions

Leaks of gases or vapors from pressurecontaining equipment, such as methane leaks from coal mines or refrigerant gases from air conditioning units

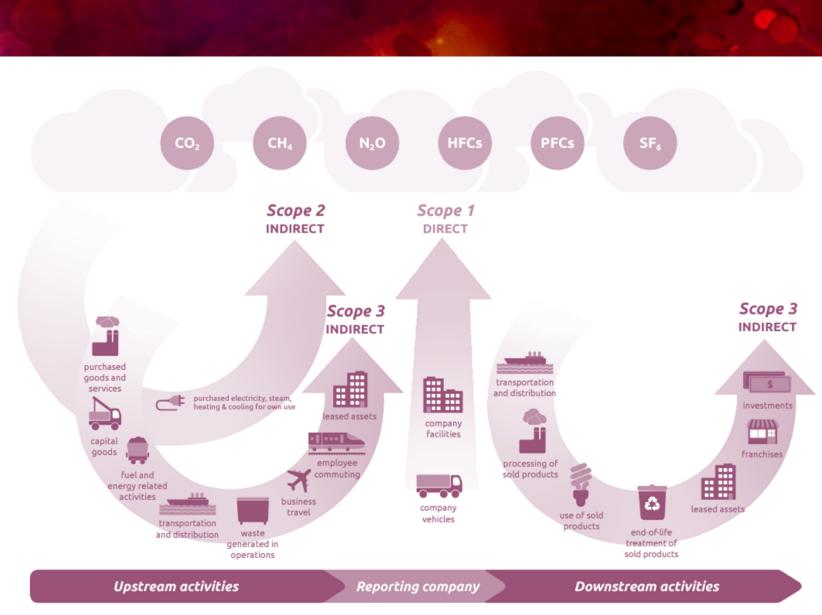

Process emissions

Emissions released during industrial processes, such as factory fumes, chemicals, and the production of CO2 during cement manufacturing

Transportation emissions

Emissions from fuels used in vehicles owned or controlled by the company, such as burning fuel in a fleet of vehicles Electricity, heat, or steam generation Emissions from burning coal to produce electricity, or from fuel combustion in boilers and furnaces

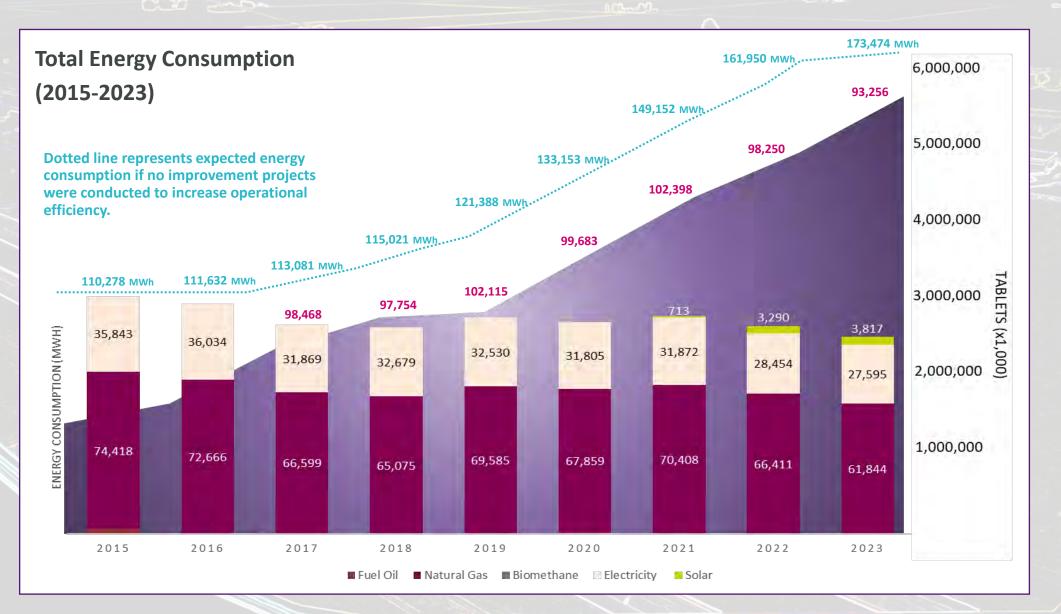

Chemical and material processing Emissions from the manufacture or processing of chemicals and materials

AZ - Mt. Vernon's Total Energy Consumption Comparisons

AZ - Mt. Vernon's Glidepath to Zero Carbon

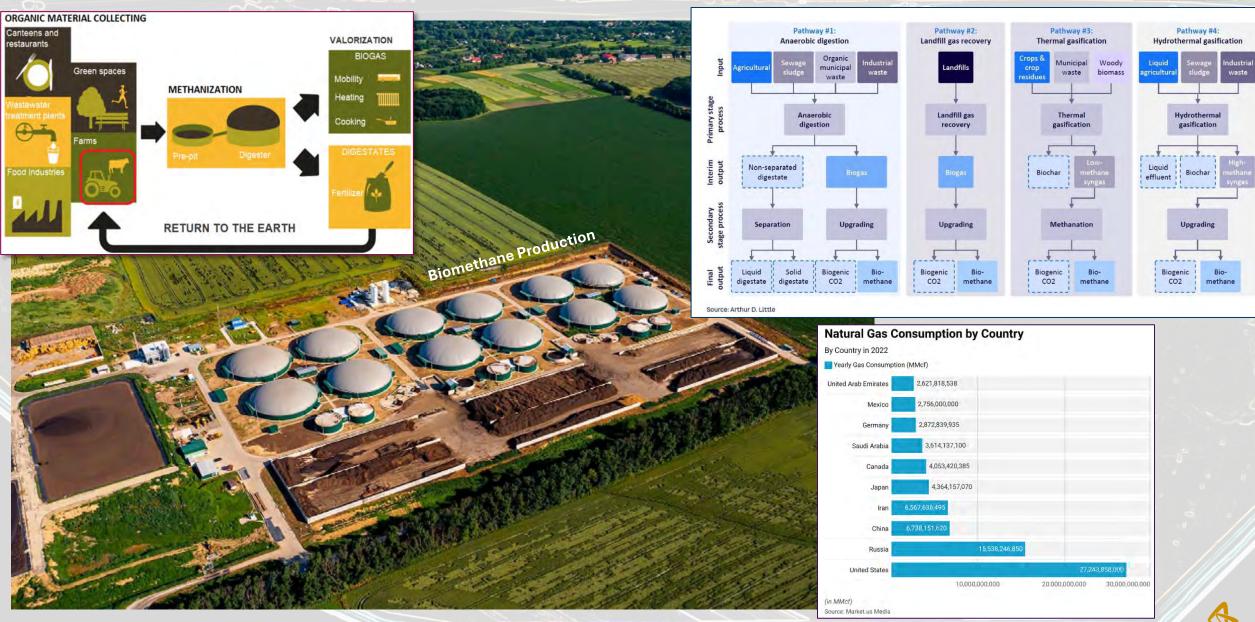

Alternative Energy Considerations (Biogas/Biomethane)

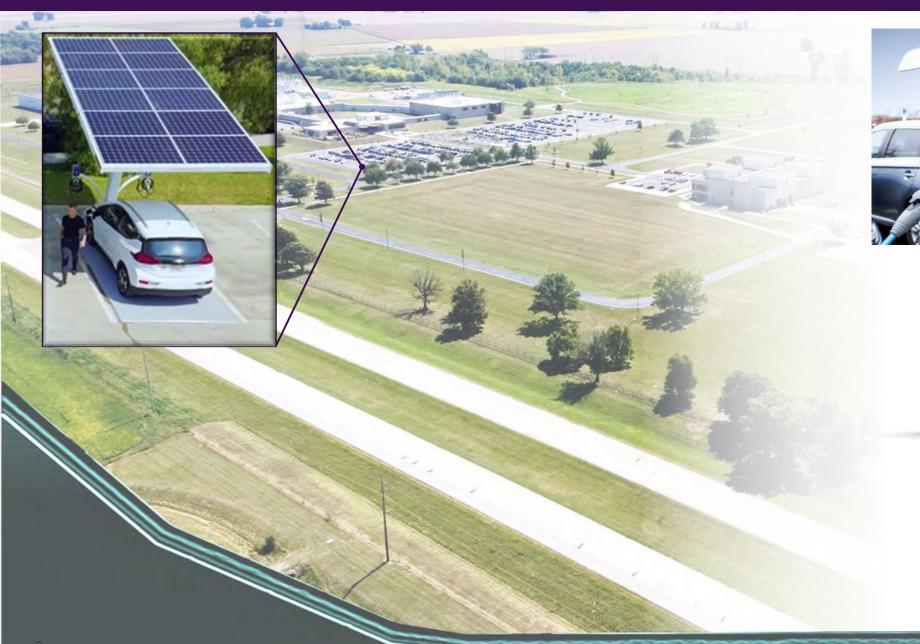

Alternative Energy Considerations (Electric Vehicle Fleet)

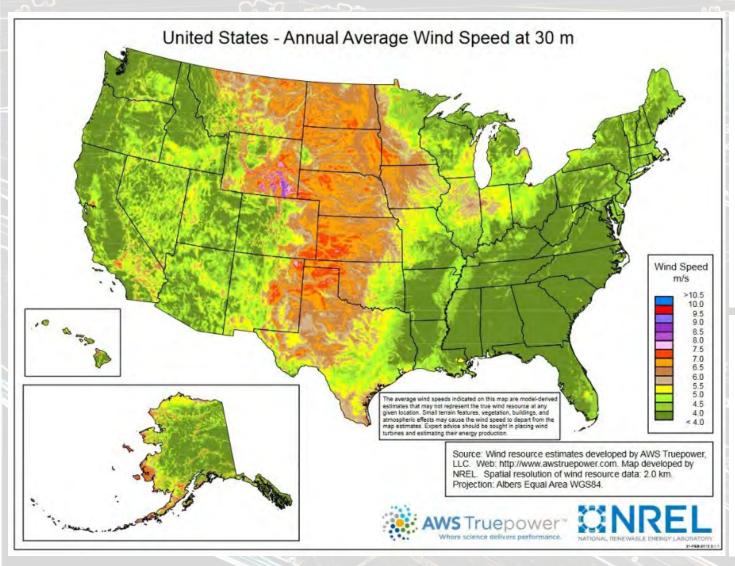

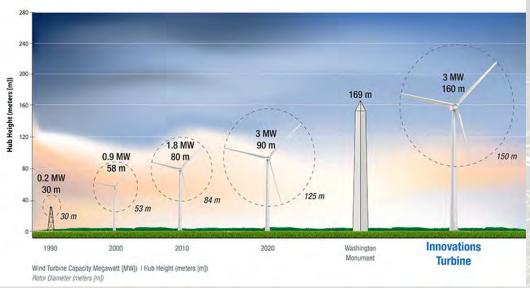

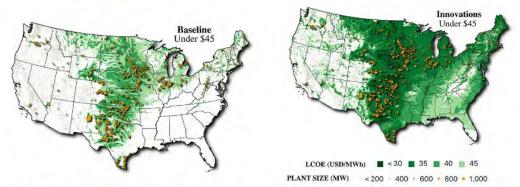

Alternative Energy Considerations (Wind)

A recent NREL study has revealed that technology innovations could unlock an additional 80% economically viable wind energy capacity as soon as 2025. Innovations in wind technology—such as on-site manufacturing, taller towers, longer blades, and wake steering—could allow wind power plants (yellow circles on maps) to be deployed in new areas of the United States (shaded regions in second map) compared with areas that are viable with current technology (shaded regions in first map). Graphic by Travis Williams, NREL, using the U.S. Geological Survey's U.S. Wind Turbine Database

Sustainability, Best Practices

Energy reduction projects,

Energy reduction and savings. CO2 emissions and energy efficiency.

Lessons learned from installation of solar panels (maintenance/capacity/switchgear considerations/backup power/etc.)

energy efficiency

calculating carbon neutrality.

Solar energy business models.

Site level energy generation ideas - hydrogen fuel cells, mini windmills, solar

Electricity

Solar

Energy

3.5 MW designed capacity

Offsets 20% annual electricity requirements in 2024

Rezoned land for agricultural use

Electricity Offset:

20% 5,100 MW of Electricity

Natural Resources

Eliminate

Burning Natural Gas

Install two eBoilers to achieve Ambition CarbonZero by 2025

100% electrically feed by renewable energy

Offsets annual burning of 225,000 dT of natural gas

Site CO2 Offset:

100% 11,800 mT of CO2

Renew

Building/Facility Infrastructure

Renewed working environment to promote wellness while reducing natural resource demand

Digital lighthouse / smart metering site

Site Energy Offset:

19% 19,000 MW of Energy

Regrow

Biodiversity

Introduce 750 trees in community annually removes 20 mT of carbon over 20 yrs life

Fortifying habitat for plant & animal species richness (Introduce St. Croix Sheep in 2024

Species Richness:

>100

Flora/Fauna (identified to date)

Conserve

Water Reuse

Increase utility water cycles / minimizes chemical usage to decrease water discharge.

Studying site water retention & reuse

Water Usage Offset:

5% 4.0 million gallons

Water

Chill Water Systems

Replace/control optimization on chiller

Cooling tower replacement

Optimize water

3% 1.5 million gallons

Zero

99%

Circular

Reuse, recycle & sell

Circular Rate: 50% 1.050 mT Reused/Recycled

SOLAR GRAZING OVERVIEW

BENEFITS OF SOLAR GRAZING

According to current and ongoing research by Cornell University and others, the use of sheep to graze solar fields may offer the following benefits:

- Improve habitat biodiversity with a higher proportion of native vegetation to support mammals, reptiles, birds, and insects.
- Allow more flowering through natural prairie grazing for bee pollinators, as well as habitat for predatory insects helping with local pest-control.
- Increase soil health (e.g., soil aeration and nutrient levels) and soil carbon accrual and sequestration.
- Reduce fuel consumption, noise, lawnmowing costs.
- Reduce the need for herbicides and pesticides.
